

Whittaker Creek Drainage

General location

General characteristics

7th field huc id = 171 0020601 0703

Parent watershed = UPPER SIUSLAW RIVER

Total acreage = 7732

Maximum elevation = 798 feet

Minimum elevation = 90 feet

Ecological Capital

15 percent of the catchment has potential to contribute lwd to the aquatic system

51 percent of the stream system has adequate shading

37 percent of the riparian area is in good condition

11 miles of stream have inherently good coho spawning and rearing habitat

31 acres of potential or existing wetlands are present within the catchment

Potential Threats

There are 95 points where roads cross over fish bearing streams

Riparian road density = 0.65 miles per square mile

Mid-slope road density = 1.38 miles per square mile

5 percent of the catchment is considered to have a high potential of land slide occurrence

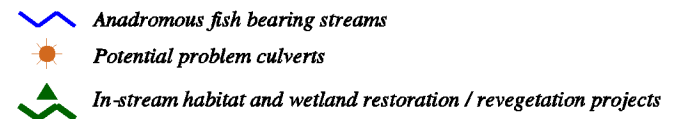

Ownership Patterns

less than 1 percent of the catchment is private non-industrial

33 percent of the catchment is private industrial

61 percent of the catchment is federally owned

4 percent of the catchment falls on other public lands

Notes

The catchment is dominated by moderate or low gradient confined or moderately confined channel habitat types. A total of 10.73 miles of stream are considered anadromous fish bearing and no miles of stream have digitized habitat surveys. A total of 7.33 miles of spawning surveys have been conducted since 1990 reflecting relatively moderate numbers of coho spawners. A total of 13.38 miles of snorkel surveys have been conducted reflecting relatively low numbers of juvenile coho.

There is most likely sufficient lwd production and input into the aquatic system. The location of lwd sources should be identified and efforts should be made to maintain production.

Stream temperatures may be high due to the high percent of streams exposed to direct sunlight. Streamside shading is most likely limiting water quality for fish habitat.

This catchment has low potential for consideration for anchor habitat status
