

Congdon Creek Drainage

General location

General characteristics

7th field huc id = = 171 002060401 03

Parent watershed = LAKE CREEK

Total acreage = 5593

Maximum elevation = 770 feet

Minimum elevation = 221 feet

Ecological Capital

9 percent of the catchment has potential to contribute bwd to the aquatic system

44 percent of the stream system has adequate shading

21 percent of the riparian area is in good condition

9 miles of stream have inherently good coho spawning and rearing habitat

9 acres of potential or existing wetlands are present within the catchment

Potential Threats

There are 39 points where roads cross over fish bearing streams

Riparian road density = 0.76 miles per square mile

Mid-slope road density = 1.85 miles per square mile

12 percent of the catchment is considered to have a high potential of land slide occurrence

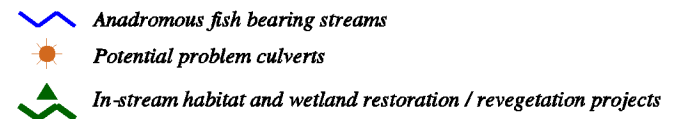

Ownership Patterns

1 percent of the catchment is private non-industrial

41 percent of the catchment is private industrial

56 percent of the catchment is federally owned

less than 1 percent of the catchment falls on other public lands

Notes

The catchment is dominated by moderate or low gradient confined or moderately confined channel habitat types. A total of 3.23 miles of stream are considered anadromous fish bearing and no miles of stream have digitized habitat surveys. A total of 2.28 miles of spawning surveys have been conducted since 1990 reflecting relatively high numbers of coho spawners.

A total of 4.79 miles of snorkel surveys have been conducted reflecting relatively low numbers of juvenile coho.

Due to lack of large diameter trees in the riparian area or directly contributing to the aquatic system, large woody debris in the stream system is most likely in short supply.

Stream temperatures may be high due to the high percent of streams exposed to direct sunlight. Streamside shading is most likely limiting water quality for fish habitat.

This catchment has low potential for consideration for anchor habitat status
